What is Rewalk?

The ReWalk™ exoskeleton allows an ambulation and rehabilitation alternative to wheelchair users, enabling people with lower limb disabilities, such as paraplegia, to stand and to walk.

The ideal candidate for successful ReWalk™ use include those with:

- Complete or incomplete spinal cord injury at T8 or below
- Good trunk control and body awareness
- Good upper extremity function and range of motion
- Adequate lower extremity range of motion to allow for ambulation
- Minimal lower extremity spasticity
- Independence with wheelchair mobility and transfers
- Active participation in a standing or gait program (KAFO, RGO, standing frame)
- Active participation in a home exercise program that focuses on flexibility and balance

Clinical Program at MedRehab

The training program is an 8-12 week program that includes sessions three times per week. Basic training includes sitting, standing and walking with the ReWalk™. In addition to focusing on walking, the goals of therapy are to improve dynamic standing balance and the ability to stand and reach.
